PixArt SPC027 Camera Driver for Windows

7,8,10,8.1,XP.The ability to break into networks offers the illusion of “getting away with it” to the hacker, but there is often very little that he or she can do after that initial infiltration. This is because once the hacker enters a network, he has the ability to take total control of that system to the extent that it serves to hide his tracks from you and others.

However, when you are responsible for the security of a network there is little else to do except attempt to find out as much as you can about his activities and then address the problem. The first job of a responsible network owner or administrator is to get on top of the situation and to understand just what is going on. What do you know about the hacker and what systems are being accessed? The answers to these questions will help you to narrow down the areas that

---

you need to start looking into. There are several avenues that you can research to get the information that you need. In this article, I will provide two methods that you can use: the generic tools that you use on a normal basis and the more specialized tools that you may need to use in a specific scenario.

1. What Tools do I use on a regular basis? This is the normal set of tools that you will be using as a typical system administrator. Your existing tools include: Wireshark - This is the standard tool that we all use for snooping around the network. It is a network packet sniffer that you install on the systems in your network and then start looking at all the traffic that is being sent across the network. This tool will allow you to determine where the hacker is coming from, what and how much information he is gathering, and even what he is doing with that information. This tool can save you a lot of headaches if you have determined that the hacker is actually trying to gain access to your network.
